

## Bonded Abrasives

### Patented Multi Layer Construction

**Top layer of glass fiber:** protects the worker against chipping off (of abrasive grains)

**Fine grit layer on top:** better connection with glass fiber reinforcement, increases safety, acts like a backup for the coarse grit

**Coarse grit layer on bottom:** improves stock removal rate, keeps grinding much longer because the fine grit backup allows higher forces against the coarse grit

**Bottom layer of glass fiber:** only half size (most competitors have full size) allows better start up, because the grains act right from the beginning (fiber glass does not grind)

**Coarse and fine grit combination:** allows to influence the surface finish on the work piece by altering the grinding angle or movement in direction to or away from the worker

## Diamond Blades

### 3 Rim Designs

**Thin Kerf Blade Design:** Provides rapid, smooth cutting, cooler operation and less dust

**Premium Steel Core:** Resists wear and offers extra stability with low vibration

**Turbo:** Ultra high speed, eliminates segment breakage

**Continuous:** Ultra high speed, eliminates segment breakage

**Segmented:** For multiple applications, allows for quick material removal
